```

The diagram illustrates the Semantic Planning Module process. It starts with an INPUT PACKAGE containing three components: User brief, Room model, and Inventory scope. These inputs feed into the SEMANTIC PLANNING MODULE. Inside this module, the User brief is processed by the Style policy compiler, which then feeds into the Relation planner. The Room model and Inventory scope feed into the Tier count director, which then feeds into the Request contract. The Relation planner also feeds into the Tier count director. Finally, the Request contract outputs the Structured requirements to the OUTPUT section.
